

Marina pump-outs

QUA-VAC BV can deliver standard pump-out units or a central vacuum sewage collection system for marinas.

Pump-outs can be placed as a standalone unit to empty the sewage holding tanks or bilge water at a central point by means of vacuum. These pump-out units can be executed with an optional software program to control a single unit or more units.

With the central vacuum sewage collection system you have at one point a vacuum station, which generates vacuum in all the piping along the docks of the marina. So every boat can empty their sewage holding tank without leaving their place. Also you can connect to this system buildings, restaurants, sanitary buildings etc to collect all the black and grey water, which will be transported, to the vacuum station.
